

**Figure S2. Treatment of cinnamon induces apoptosis in adenocarcinoma cell.**

To test whether cinnamon extract could also induce apoptosis in other cancer cells, cinnamon extract (0.5 mg/ml) was treated in Caco2 cells (human epithelial colorectal adenocarcinoma cell line) for indicated time points. Apoptotic population was analyzed by staining with Annexin-V and 7-ADD at each time point. Error bars indicated SD. One (\*), two (\*\*) or three asterisks (\*\*\*) indicate  $p < 0.05$ ,  $p < 0.005$  or  $p < 0.001$ , respectively. Data are representative of three independent experiments.
