Title: The association between lack of sleep, low vitality and impaired glucose tolerance: a Swedish cross-sectional study

Version: 2 Date: 24 May 2013

Reviewer: Juha Saltevo

Reviewer's report:

The conclusion in the abstract is not clear when the authors talk about low vitality. If the low vitality is not associated statistically significantly in men, why the authors state that it SEEMS ASSOCIATED WITH IGT IN BOTH SEXES? The whole sentence is not clear and too long. This is important, because the main message of this study is here.

Page 4 (there are NO page numbers) at the end. The Finnish trial on IGT(16). It is better to write: the Finnish Diabetes Prevention Study on IGT.

Table 1: BMI on NGT Group is only 6.5. Please, correct.

Maybe it should be added to the limitations of study that HbA1c values are not done.

After these corrections this study can be accepted.
