Reviewer's report

Title: Sociodemographic and socioeconomic differences in sleep duration and insomnia-related symptoms in Finnish adults

Version: 1 Date: 16 May 2012

Reviewer: Alan Eckeli

Reviewer's report:

It is a well-designed study that evaluated the interactions between the sociodemographic, socioeconomic, sleep duration and insomnia-related symptoms in a representative population sample of the adult population of Finland.

Discretionary Revisions,

1. Knowing that the data are related to the period between 2000 and 2001, and the data were analyzed now, in 2012, it is important to emphasize that it is possible that changes have occurred, and it could alter the conclusions of this study. For example, over the past 12 years we observe a large spread of the use of electronic media, although although the precise effects and mechanisms remain unclear, it appears that the use of electronic media have a negative impact on the sleep. So caution is needed in generalizing the data to the present day.

2. Key words:

Why use the word "children" as key word?
I say that, because the population evaluated in the research involves adults over 30 years.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the
statistics.
