Reviewer's report

Title: Electroesophagogram in Gastroesophageal Reflex Diseases with a New Theory on The Pathogenesis of its Electric Changes

Version: 1 Date: 28 April 2004

Reviewer: Carmelo Scarpignato

Reviewer's report:

General

This is a straightforward paper confirming that more severe GERD is associated with impaired esophageal peristalsis.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

Discretionary Revisions (which the author can choose to ignore)
Can the authors comment on the possibility of taking an ElectroEsophagogram (EEG) via cutaneous electrodes? This would make the diagnostic use of EEG they suggest more feasible.

What next?: Accept after discretionary revisions

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No
