Reviewer's report

Title: Acute spontaneous subdural hematoma caused by skull metastasis of hepatocellular carcinoma

Version: 2 Date: 17 January 2015

Reviewer: Ilker A. Turan

Reviewer's report:

Chye et al. report a case of HCC metastasis to the cranium with the initial clinical presentation of acute spontaneous subdural hematoma. HCC metastasis to the cranium and its association with epidural hematoma has been reported occasionally. The interesting point about this case is the spontaneous subdural hematoma due to metastatic HCC. There is no other case in the pertinent literature.

I have some comments on the presented case:

Minor Essential Revisions

1. Please discuss why skull metastasis from HCC could cause subdural hematoma instead of epidural hematoma in the presented case, as distinct from other reported cases in the literature.

2. It would be useful to show the histology of the resected specimen compatible with HCC.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
