Reviewer's report

Title: Prevalence of hypercoagulable disorders in inflammatory bowel disease

Version: 2 Date: 12 February 2013

Reviewer: Antoni Stadnicki

Reviewer's report:

The authors presented large group of IBD patients enrolled to the study - 110 CD patients and 43 UC patients. This is prospective and complex study related to coagulation and fibrinolytic abnormalities accomplished in a large series of Czech patients with active and inactive inflammatory bowel disease. One or more abnormal parameters were found in 88% of IBD patients. In the revised manuscript, the authors have answered to all points underlined in previous (first) version of the article.
