Reviewer’s report

Title: Intramedullary neurocysticercosis presenting as Brown Sequard Syndrome

Version: 3 Date: 29 September 2014

Reviewer: Joost van Middendorp

Reviewer’s report:

This is the third known report on an Intramedullary Spinal Neurocysticercosis presenting as a Brown-Sequard Syndrome. The authors cite another paper where 53 cases of Intramedullary Spinal Neurocysticercosis leading to spinal cord symptomatology have been presented. As such, the novelty of current case report is limited. This in combination with the lack of valuable additional clinical findings/considerations described by the authors and inaccurate/incomplete reporting of the recovery (i.e. "partialyl clinical improvement", not further specified) leads this reviewer to the recommendation to reject the current case report for publication.

Level of interest: An article of insufficient interest to warrant publication in a scientific/medical journal

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
